thesis.

Conviction, with a counterargument

A research committee for the decisions that deserve a second opinion

Shivam Gupta
Open Agent Hackathon 2026
Track 3: Reasoning Architecture

A compelling stock is easy to find. A defensible decision is harder.

For a self-directed investor researching across markets

01

Find a candidate

Screeners surface companies. The shortlist keeps growing.

02

Challenge the case

A persuasive explanation can leave its weak assumptions hidden.

03

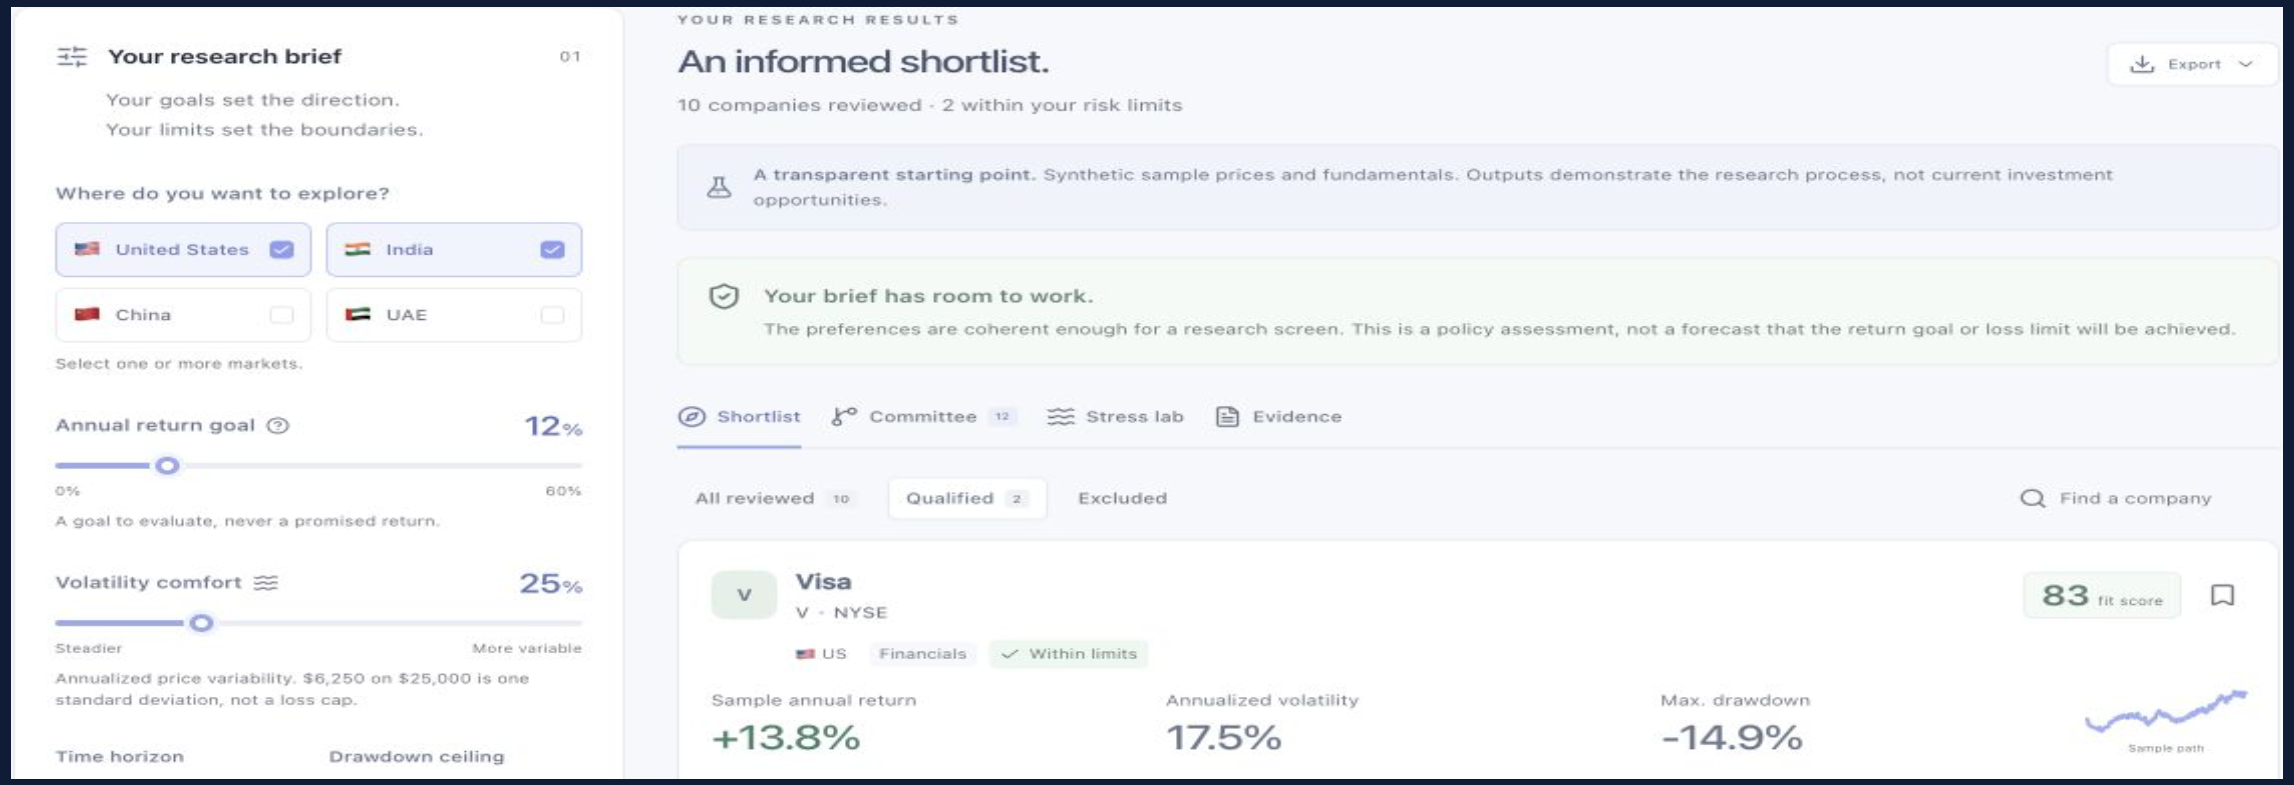

Remember the decision

Risk limits, rejected alternatives and invalidation triggers get lost.

“What fits my limits, and what would change my mind?”

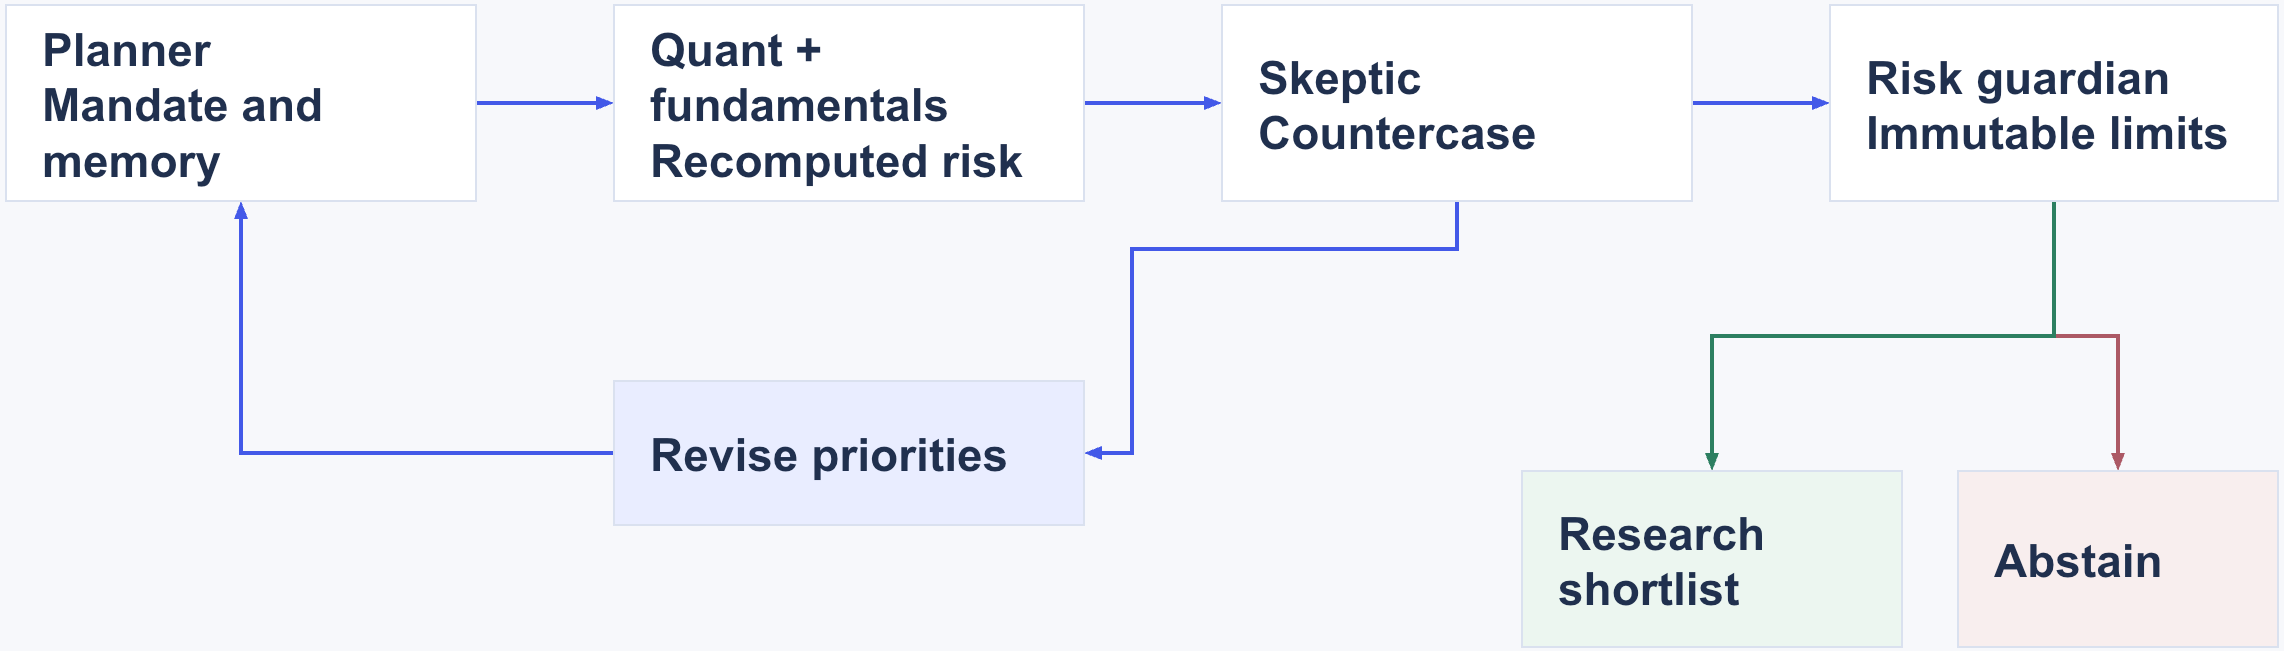

A brief becomes a reviewable decision.

Four markets. Explicit risk limits. A thesis and a counterargument.

Product workflow shown with clearly labeled synthetic sample data

Adaptive critique. Deterministic guarantees.

State carries context. Models never override hard risk limits.

The most useful answer can be “no”.

A return goal is an aspiration. A risk constraint is a boundary.

ILLUSTRATIVE RESEARCH MANDATE

40% return goal
5% volatility comfort
6-month horizon

Committee abstains

It explains the conflict, preserves the rejected cases and makes zero model calls for this mandate.

Historical risk measures do not cap future losses.

Every sponsor component has a specific job.

Meterless H-MEM	Retains decisions and recalls relevant context	Verified reference engine; 13/13 conformance checks
Meterless Nightshift	Runs the bounded skeptical model review	Real Qwen runtime receipt retained
Zetaris	Federates the research universe and provenance	Adapter implemented; live verification pending
NVIDIA Nemotron	Audits exclusions and requests a planner recheck	Nemotron Mini 4B Two real receipts retained

A real infrastructure call over synthetic inputs remains a sample-data demonstration.

Trust comes from constraints you can inspect.

Risk stays deterministic

Models cannot rewrite volatility, drawdown or the user’s limits.

Evidence remains scoped

Unknown candidates and foreign evidence IDs trigger rejection.

Recovery stays bounded

One repair, explicit deadlines and a visible failure state.

Personal records stay scoped

Server-side identity checks protect research, notes and memory.

50 tests and 14 API checks passed from a clean checkout.

A research habit is the business hypothesis.

$19

per month, proposed individual plan

Bounded research allowance
Saved evidence dossiers
Revisit and revise a thesis

Provisional variable-cost ceiling: $3.80 per active subscriber.

Pricing and demand are unvalidated. Licensed data may dominate inference cost.

Research decisions retain their context.

Market tools

Deep data, screeners, filings and watchlists.

Established category

Thesis today

Risk vetoes, countercases, source registers and explicit invalidation.

Implemented workflow

Thesis over time

Revisit why a decision changed
as evidence and investor preferences evolve.

Product validation goal

From a working committee to a trusted product.

01 **Verify the financial evidence**

Licensed data, source freshness and complete Zetaris execution.

02 **Validate the research habit**

Five observed users, countercase comprehension and paid-pilot interest.

03 **Earn launch readiness**

Security review, monitoring, backups and jurisdiction-specific review.
